

X-CLASS HEAVY-DUTY PUMP

**Standardized pump NX for chemicals
DIN EN ISO 2858**

**Standardized Close-coupled plastic
pump BX for chemicals according to
DIN EN ISO 2858**

Features

- X-CLASS is the beginning of a new generation of powerful heavy-duty plastic pumps
- Based on innovative strength and over 60 years of expertise in the use of thermoplastics, we have set a new milestone in the shape of a future-oriented, efficient and reliable pump system. It can withstand anything.
- Chemical pump made of plastic
- Extreme resistance
- Maximum safety
- Long-lived and sturdy
- Significantly improved service life
- Pump in sandwich design (simple assembly)
- The standard pumps for chemicals are also available in a block design under the type designation BX.

www.stuebbe.com/en/products-systems/pumps/

Use

- for handling aggressive, crystallizing and toxic fluids as well as fluids filled with solids

Customized hydraulic systems

Can be selected according to application:

Semi-open pump impellers (H):

- as a default for smaller pump sizes
- recommended for fluids filled with solids

Closed impellers (G):

- For larger pump sizes

Customized 3-channel non-chokable impellers (F):

- For extreme cases with large solid particles or contamination

All designs are marked with the 3rd letter in the type designation.

Pump variety

- 18 different pump sizes up to 1,000 m³/h for even the most difficult conveying tasks

Maximum safety

- Full sheathing of the thick-walled plastic components, protects the plastic components against UV light, among other things
- The chamber design provides a certain protection in the event of sudden, strong leaks
- Great system safety
- Improved protection against injuries of the operating personnel

Long-lived and sturdy

- Metal chamber design absorbs a significant part of the pipework forces
- Highly resilient fixed/floating bearing (only NX)
- Anti-friction bearings lubricated for life by default
- Reinforced bearing available with grease or oil lubrication
- Sturdy universal shaft for each available end face mechanical seal types
- Chamber design of round seals

ATEX-compliant

According to directive 2014/34/EU (ATEX):

- Unit group II
- Category 2G
- Temperature class T₃ or T₄
- Do not use pump with combustible or explosive fluids

Material variants

Depending on the mechanical, chemical, thermal or abrasive load, several materials are available for different applications:

- UHMW-PE (ultra high molecular low-pressure polyethylene)
- PP-H (homopolymeric polypropylene)
- PVDF (polyvinylidene fluoride)
- PFA / PTFE (perfluoralkoxy / polytetrafluorethylene)

All designs are marked with the 4th letter in the type designation.

Special features

- fully sheathed plastic components
- pressure level PN 16
- self-developed, innovative end face mechanical seal module kit (single- and double-acting), customized for STÜBBE X-Class pump
- ATEX-compliant according to directive 2014/34/EU
- available as close-coupled pump (type designation BX) with its own shaft bearing throughout and flange motor design up to pump size 125-100-200
- Non-chokable design with 3-channel impeller

Options

- Draining and rinsing connections
- FDA approval for plastics and auxiliary seals
- conductive plastics available
- customized hydraulic systems on request

X-CLASS Heavy-Duty Pump – Standardized pump NX for chemicals / Standardized Close-coupled plastic pump BX for chemicals

Designs

Pump NX (process design)

- Special design principle, which significantly reduces assembly times during repair work, as neither the pipework connection nor the motor need to be dismantled to remove the bearing support (including the impeller and end face mechanical seal).
- Easy to assemble, clamped double-cardanic coupling facilitates assembly work

Pump BX (close-coupled pump design)

- The standard pumps for chemicals are also available in a close-coupled pump design under the type designation BX.
- Unlike the design of most competitors, this product series has its own shaft bearing as a special feature all the way through size 125-100-200, making assembly and disassembly comparable to a standard pump, as the pump is not „set up“ on a motor shaft.
- The pump has a hollow shaft, which is pushed into the flange motor.
- An elastic coupling is used for power transmission.
- The design of the BX permits replacement of wear parts without disconnecting the pump housing / pipework connection.

Mechanical seals

- All available mechanical seals were developed in-house and are based on an innovative mechanical seal module kit to allow flexible responses to any requirements.
- For the single-acting mechanical seal, a bellows version or a high-pressure version for high inlet pressures (up to max. 8 bar) is available, which can be configured with quench and/or permanent or standstill rinsing, if necessary.
- The double-acting STÜBBE mechanical seal also uses the module system and covers particularly difficult applications.

Single-acting PTFE bellows mechanical seal

- (PTFE) bellows with spring support
- Universal chemical resistance, as the spring does not touch the fluid
- up to 115 °C and up to 3 bar(g) inlet pressure
- up to 8 bar(g) static pressure
- Torques are transferred at the slide and counter ring via an extremely stable tooth system (not via the clamping system) (high breakaway torque for bonding and adhesion forces)
- Suitable for fluids filled with solids
- Can be configured with quench and/or permanent or standstill rinsing, if necessary

**X-CLASS Heavy-Duty Pump – Standardized pump NX for chemicals /
Standardized Close-coupled plastic pump BX for chemicals**

Single-acting mechanical seal, type UV2

- universal chemical resistance
- high-pressure resistant, single mechanical seal in „REA design“ with sturdy spring
- up to 160 °C and up to 8 bar(g) inlet pressure
- up to 16 bar(g) static pressure
- SSiC counter ring
- SSiC slide ring
- suitable for fluids filled with solids and applications with a high system pressure
- Torques are transferred at the slide and counter ring via an extremely stable tooth system
- Suitable for fluids filled with solids
- Can be configured with quench and/or permanent or standstill rinsing, if necessary

Double-acting mechanical seal, type UV3

- universal chemical resistance
- high-pressure resistant, double mechanical seal in „REA design“ with sturdy spring
- up to 160 °C and up to 8 bar(g) inlet pressure
- up to 16 bar(g) static pressure
- identical counter ring on the product side as for single-acting mechanical seal-modular principle
- The high-end solution for critical applications (e.g. in all cases where no sealing water or rinsing water may enter the transported fluid)

Sectional drawing

Item	Description
1	Sturdy universal shaft for any end face mechanical seal
2	Sturdy fixed/floating bearing (only NX)
3	Anti-friction bearing lubricated for life (standard)
4	Mechanical sealing with universal chemical resistance (STÜBBE in-house development)
5	Round sealing ring with chamber design
6	Fully metal sheathed plastic components
7	Plastic components individually replaceable
8	Pipework forces are absorbed by metal components
9	Efficient hydraulic system
10	60 years of expertise in the use of thermoplastics

Item	Description
11	DIN/ANSI connections available for delivery
12	All mechanical seal connections always on the side and horizontal Pump in sandwich design (simple assembly) ATEX-compliant according to directive 2014/34/EU, size II, 2G according to T3 or T4
